

Accepted L3 exhibit 1 | Seasonal calibration

Source chart preserved in full; accepted implementation does not adopt a financial forecast.

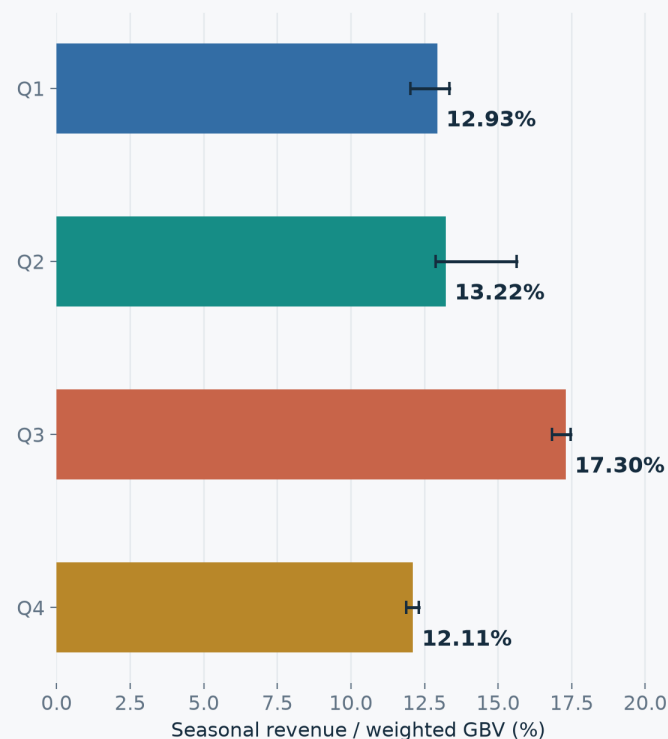

One shared weight. Four seasonal conversion rates.

FULL-SAMPLE CALIBRATION | 22 quarters: 2021 Q1–2026 Q2 | USD-level least squares, no intercept

Descriptive fitted relationships; no forecasting claim. Thin ranges: 95% year-block resampling sensitivity (6 year blocks).
w is a reduced-form lag coefficient, not a booking probability or actual revenue contribution share. Source: frozen Airbnb KPI panel/calendar.

Shared first-lag coefficient $w = 0.786$

Interpretation limits

Accepted all22 descriptive fit (2021Q1-2026Q2), not operational coefficient adoption.

Four seasonal coefficients and one shared fitted weight; fixed and free fits are descriptive.

Seasonal stability does not identify physical booking-to-revenue cohort probabilities.

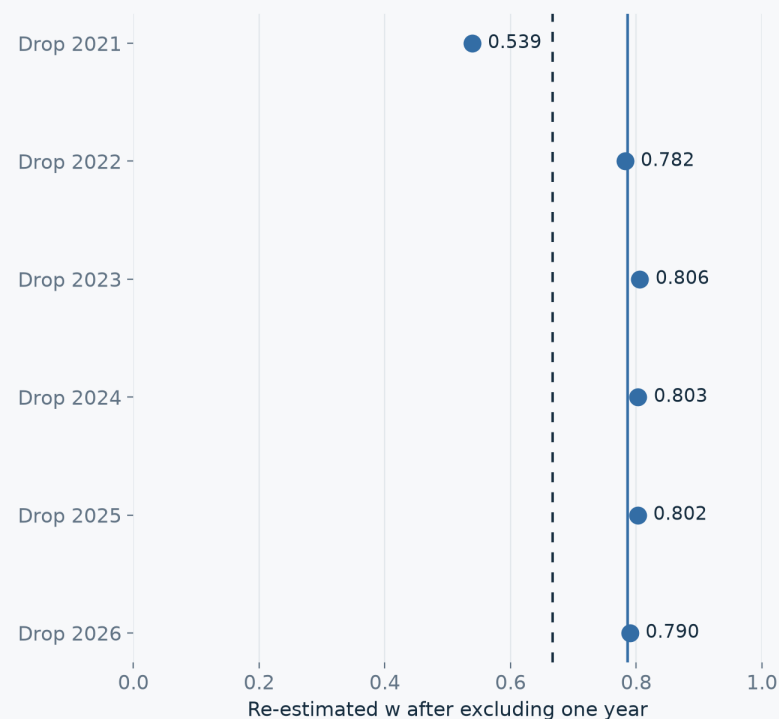

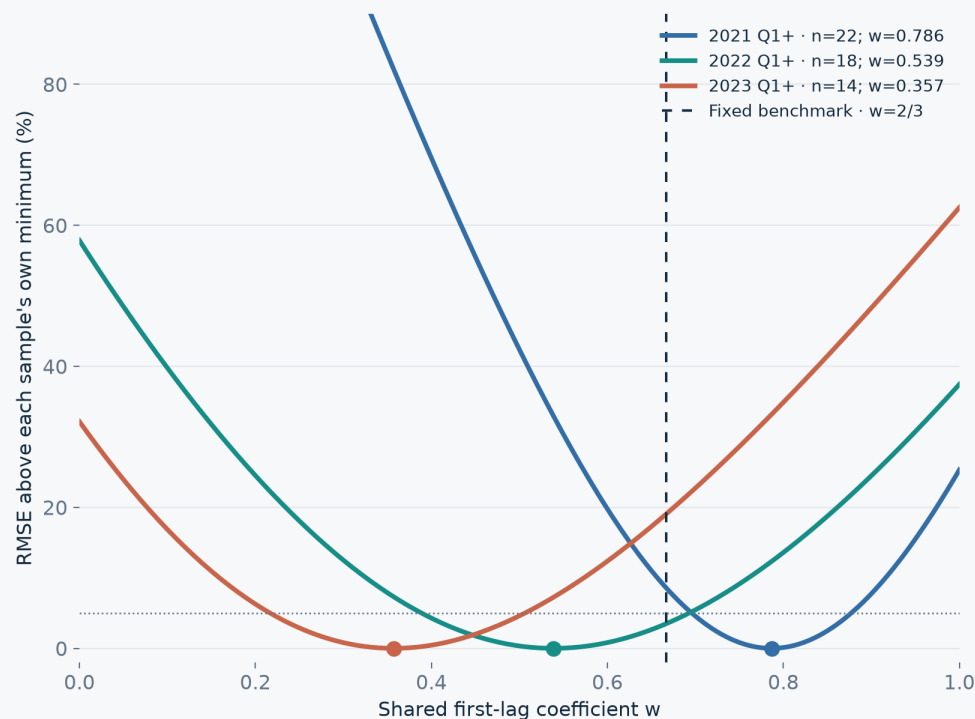

Accepted L3 exhibit 2 | Weight identification

Source chart preserved in full; accepted implementation does not adopt a financial forecast.

The fitted lag moves when the estimation period changes.

IDENTIFICATION SENSITIVITY | All 22 quarters remain the primary descriptive fit | Each profile re-fits all four seasonal rates

Year-block sensitivity: 0.31–0.86

Profiles and leave-year-out fits are descriptive sensitivity, not chronological validation. Dotted 5% line is a flatness diagnostic, not a confidence interval. Year-block percentile range uses 1,000 draws over only six calendar years, including partial 2026; precise structural identification is unsupported.

Interpretation limits

Identification and year sensitivity; six historical year blocks provide limited independent information.

Keep weight and seasonal coefficients jointly paired. Marginal extremes are not coherent cases.

All22 $w=0.786478$ is descriptive; neither this weight nor new fixed OLS replaces existing K0 policy.

Accepted L3 exhibit 3 | Chronological validation

Source chart preserved in full; accepted implementation does not adopt a financial forecast.
