

V | Valuation arithmetic: three different price objects

PARTIAL · Arithmetic reconciles; source vintages and exit-level inference remain unverified. No direction adopted.

Rank only	Growth sensitivity (n=1)	FY27 EBITDA lens (n=1)	Six-lens field (n=6)	Memo event analogue (n=2 ends)
Bear	9.18% → 15.47x \$170.64	13.5x \$108.46	\$74.18 [\$37.23–108.46]	\$140–152 [12.37–13.58x]
Base	10.35% → 16.03x \$176.27	16.5x \$180.88	\$156.79 [\$110.58–196.92]	\$170–185 [15.40–16.92x]
Bull	11.52% → 16.60x \$181.89	18.5x \$234.16	\$228.18 [\$176.49–281.01]	\$205–215 [18.94–19.95x]

Shown arithmetic: $x = 16.5 + 0.486022 \times (g - 11.3086)$; $P = (x \times \$5,685.77\text{M} + \$10,115.99\text{M}) / 574.5982\text{M}$.
Growth sensitivity fixes EBITDA, cash and shares. Row ranks align for comparison; these are not identical scenarios.

Relation: +0.4860 turns/pp; HAC95% [0.3172, 0.6548]. Dependent variable is the 12-row change in EV/LTM EBITDA. W1 n=35, W2 n=33 overlapping monthly changes; four parameters. Forward-multiple LEVEL slope W2 = +0.1948 [−0.3233, +0.7129]. 47/47 reported-quarter date labels pass, but complete component vintages are unverified: zero scored forecasts.

Positioning: \$170.19, close 2026-09-11. Short float 3.44% / 14,228,547 shares / 2.56 days (Yahoo settlement date 2026-08-31); targets mean \$182.125, median \$185, range \$125–220 (n=40). Existing 6 Sep rating split: 21 Buy / 11 Hold / 2 Sell (n=34). Current target SD unavailable. Yahoo snapshot retrieved 2026-09-13T00:18:59.397636+00:00; not a historical guide-date snapshot.

Three unresolved inconsistencies: (1) A change slope does not identify an exit-level intercept. (2) Preliminary model inputs yield base \$191.317; final inputs yield \$180.88; the six-lens mean is \$156.79. (3) Event branches omit a complete earnings/cash/share bridge: +1 turn adds \$9.89 at fixed base inputs. All model prices retain the ~30 Sep 2027 target convention and the weighted-average-share proxy caveat.
